

I've been an FCC licensed ham since 1974 and certainly understand the balancing act that the FCC must do in allocating frequencies. While there is more demand for UHF frequencies these days from commercial interests, a lot of hams would appreciate additional allocations in the HF region. A sixty meter band would clearly help us cope with the vagaries of HF propagation (especially important for emergencies such as natural disasters) and I think our successful use of 30 meters as a shared allocation shows we could do the same at 60 meters. Keep up the good work. Regards, Mark Gilbert N1MG
